NOTIFICATION OF TRANSMITTAL OF THE INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

(PCT Rule 71.1)

Date of mailing

(day/month/year)

28.04.2005

Applicant's or agent's file reference

TAB/P62186WO00
International application No.

PCT/GB2004/000077

International filing date (day/month/year)

09.01.2004

IMPORTANT NOTIFICATION

Priority date (day/month/year)

10.01.2003

Applicant

DE LA RUE INTERNATIONAL LIMITED et al.

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary report on patentability and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

#### 4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary report on patentability. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

The applicant's attention is drawn to Article 33(5), which provides that the criteria of novelty, inventive step and industrial applicability described in Article 33(2) to (4) merely serve the purposes of international preliminary examination and that "any Contracting State may apply additional or different criteria for the purposes of deciding whether, in that State, the claimed inventions is patentable or not" (see also Article 27(5)). Such additional criteria may relate, for example, to exemptions from patentability, requirements for enabling disclosure, clarity and support for the claims.

### **Re Section III**

Rule 6.2(a) PCT

### Re Section V

Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1) The following document is referred to in this communication:

D1: WO 92/11142 A

2) The document D1 is regarded as being the closest prior art to the subject-matter of claim 1 and shows (the references in parentheses applying to this document):

A security element (2) comprising an elongate strip of a light transmitting polymeric substrate, said substrate being provided with a magnetic feature and a metallic design, the metallic design being provided by a combination of metal and non-metallic regions (3,4) and comprising indicia, characters, patterns, designs, or geometrical shapes or a combination of the aforesaid design (5) comprising at least one repeating pattern of which one or more of the frequency, the instantaneous amplitude (5) and/or the maximum amplitude of the pattern varies along the length of the element, said pattern being positioned relative to the magnetic feature such that it does not overlap therewith. (cf. claim 1)

The subject-matter of claim 1 differs from this known security element in that:

The frequency, instantaneous amplitude and/or the maximum amplitude of the pattern varies **constantly** along the length of the element.

The subject-matter of claim 1 is therefore new (Article 33(2) PCT).

3) The problem to be solved by the present invention may be regarded as:

To improve the public security aspects of machine-readable security threads.

This problem is solved by having a repeating pattern of a combination of metallic and non-metallic regions which varies constantly along the length of the security thread.

# INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

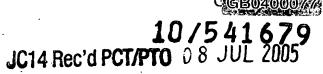

International application No.

PCT/GB2004/000077

- 4) The solution to this problem proposed in claim 1 of the present application is considered as involving an inventive step (Article 33(3) PCT) for the following reasons:

  No available document shows the claimed solution to this problem. Nothing appears to lead a person skilled in the art to the claimed solution.
- 5) The same reasoning applies for independent claim 22, which refers to a security document made from the security substrate containg the above security element.
- 6) Claims 2-21 and 23-25 are dependent on claim 1 and 22 resp. and as such also meet the requirements of the PCT with respect to novelty and inventive step.

\_ 1

provided a security element comprising an elongate strip of a light transmitting polymeric substrate, said substrate being provided with a magnetic feature and a metallic design, the metallic design being provided by a combination of metal and non-metallic regions which permit the transmission of light and comprising indicia, characters, patterns, designs, or geometrical shapes or a combination of the aforesaid design incorporating at least one repeating pattern of which one or more of the frequency, the instantaneous amplitude and/or the maximum amplitude of the pattern varies constantly along the length of the element, said design being positioned relative to the magnetic feature such that it does not overlap therewith.

15

20

25

30

10

Key to the current invention is the recognition that the primary level of authentication in the majority of cases is by public inspection. Though the inventors recognise that machine inspection is typically of paramount importance when authenticating a document, this may only occur a limited number of times during the life of a document. In some instances this may only be twice, just prior to issuance by a central bank and upon return to a central bank. A far more regular occurrence is the need for the public to rapidly authenticate a document either with or without any additional aids. inventors have recognised that in both EP-A-0516790 and EP-A-0961996 the visual aspects of the security element have been compromised in order to accommodate the magnetic and machine-readable aspects. in both patent specifications show the demetallised, public recognition, region constrained in order to allow for the magnetic features.

35

Within the current invention it is the visual

- 18 -

#### CLAIMS:

- 1. A security element comprising an elongate strip of a light transmitting polymeric substrate, said substrate being provided with a magnetic feature and a metallic design, the metallic design being provided by a combination of metal and non-metallic regions which permit the transmission of light and comprising indicia, characters, patterns, designs, or geometrical shapes or a combination of the aforesaid design incorporating at least one repeating pattern of which one or more of the frequency, the instantaneous amplitude and/or the maximum amplitude of the pattern varies constantly along the length of the element, said design being positioned relative to the magnetic feature such that it does not overlap therewith.
  - 2. A security element as claimed in claim 1 in which the magnetic feature comprises a continuous layer.
- 20 3. A security element as claimed in claim 1 in which the magnetic feature comprises a discontinuous layer.
- A security element as claimed in any one of the preceding claims in which the magnetic feature comprises
   indicia, characters, patterns, designs, geometrical shapes or the like.
  - 5. A security element as claimed in any one of the preceding claims in which the magnetic feature comprises a machine readable bit pattern sequence.
    - 6. A security element as claimed in any one of the preceding claims in which pattern is provided by demetallised regions in a metal layer.
  - 7. A security element as claimed in claim 6 in which the metal layer covers the magnetic feature.
